FINAL REPORT

General Demographic Trends for Metropolitan Areas, 1960 to 1970

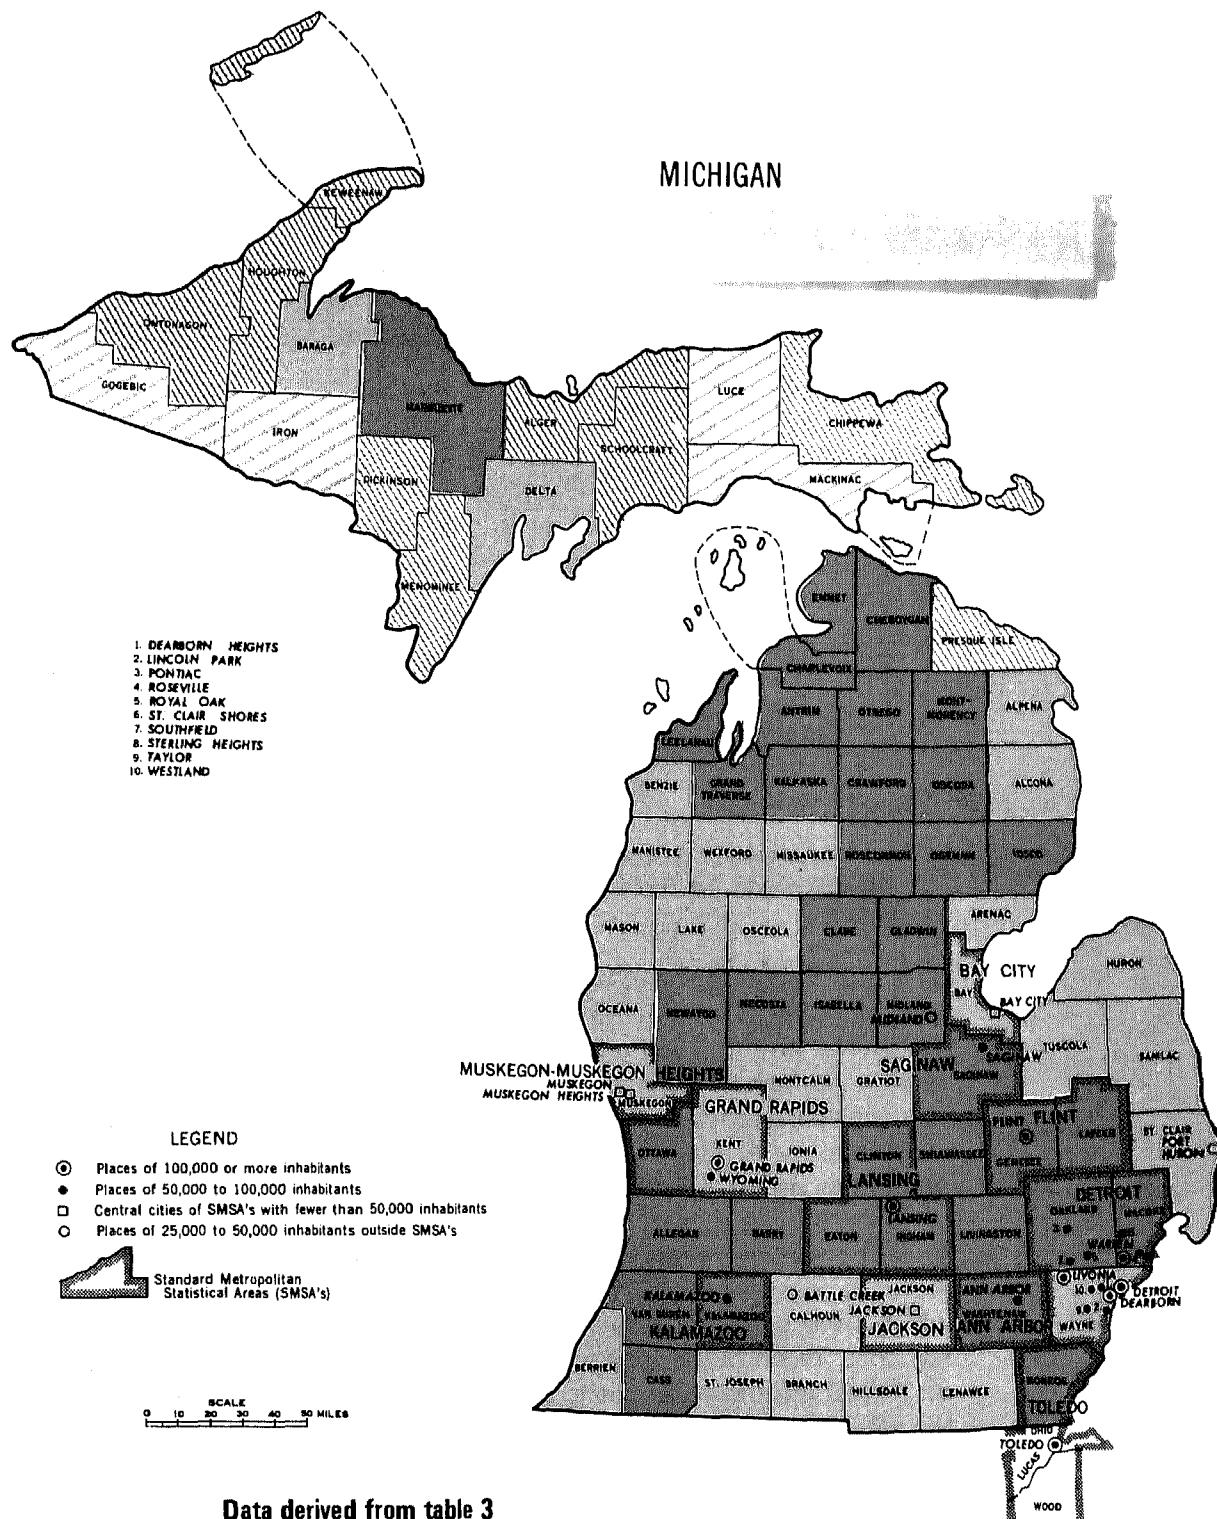

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by county appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and county in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

POPULATION TRENDS

General

Between 1960 and 1970 the population of Michigan grew from 7,823,000 to 8,875,000, at the same rate as the United States population overall, 13 percent. Nearly all the State's growth occurred in the suburban parts of

metropolitan areas, which grew by 946,000 persons to a population of 4,338,000 in 1970 (table A). Nonmetropolitan areas, which in 1970 had a population of 2,069,000, accounted for only one-tenth of the State's growth during the decade (208,000). In contrast, the central cities of metropolitan areas lost population between 1960 and 1970. Although nearly all central cities annexed some suburban territory over the decade,

Table A. Population by Race and Metropolitan and Nonmetropolitan Residence:
1970 and 1960

The State Metropolitan and Non- metropolitan Residence	Population		Change		Percent Distribution	
	1970	1960	Number	Percent	1970	1960
Total.....	8,875,083	7,823,194	1,051,889	13.4	100.0	100.
Metropolitan residence...						
Inside central cities..	6,806,151	5,962,457	843,694	14.2	76.7	76.
Outside central cities.	2,468,063	2,570,259	-102,196	-4.0	27.8	32.
Nonmetropolitan residence						
White.....	4,338,088	3,392,198	945,890	27.9	48.9	43.
	2,068,932	1,860,737	208,195	11.2	23.3	23.
Negro and other races

Nonmetropolitan residence						
Inside central cities..	1,639,350	1,983,241	-343,891	-17.3	18.5	25.
	4,191,233	3,289,153	902,080	27.4	47.2	42.
	2,002,891	1,813,471	189,420	10.4	22.6	23.

(table B), their combined population declined, from 2,570,000 in 1960 to 2,468,000 in 1970.

The proportion of the State's population which lives in metropolitan areas was hardly affected by these changes, rising by less than one percentage point. In 1970, nearly 77 percent of Michigan's population was metropolitan, compared to 69 percent in the Nation as a whole. The proportion of Michigan's population living in central cities was reduced, on the other hand, from 33 percent in 1960 to 28 percent in 1970, and the suburban share rose correspondingly, to 49 percent by 1970.

The total number of households in Michigan in 1970 was 2,653,000, or 414,000 more than in 1960. The population living in households increased less rapidly than the rate at which households increased, with the result that average household size decreased slightly, from 3.4 to 3.3 persons.

In 1970, 88 percent of Michigan's population was white (7,833,000 persons), down from 91 percent in 1960. Over the decade, the population of other races (1,042,000 persons), which is predominantly Negro, grew four times as fast as the white population (by 41 percent compared to less than 11 percent). While there was a small net outmigration of whites between 1960 and 1970 (124,000 persons), half of the growth of races other than white was due to net immigration (151,000).

Both racial groups are found in largest numbers in metropolitan areas. At the time of both censuses, 74 percent of the white population and 94 percent of the State's population of other races were in metropolitan areas. Within metropolitan areas, there are considerable differences in growth patterns by race. While the white population of central cities declined (by 344,000 persons, or 17 percent), Negroes and other races in the

central cities show substantial growth (of 242,000 persons, or 41 percent). By contrast, although growing at the same rate as in the cities, the population of Negro and other races contributed little to the growth of the suburbs during the decade (44,000 or less than 5 percent of the total increase there), but the number of whites in the suburbs grew faster than in any other area of the State (by 902,000, or 27 percent). As a result of these developments, whites decreased as a proportion of all central city residents, from 77 percent in 1960 to 66 percent in 1970, but continued to comprise 97 percent of all suburban residents.

The growth of both metropolitan and nonmetropolitan areas in Michigan was due mainly to the natural increase of the population (the excess of births over deaths) and only to a very minor extent to net immigration (see table 3). Net migration was a more powerful force within metropolitan areas, however. Central cities show a loss of 367,000 persons as a result of net outmigration over the decade, equivalent to 14 percent of their total 1960 population. Suburban areas, at the same time, gained 385,000 net immigrants, which accounted for 40 percent of total suburban growth.

The age distribution of Michigan's population changed significantly between 1960 and 1970. In metropolitan and nonmetropolitan areas, the population under 5 years of age was reduced 17 percent. Least change was experienced by the 25 to 44 age group, which increased by less than 1 percent in the State as a whole. All other age groups grew substantially, particularly the population 15 to 24, which had an increase of 56 percent. Similar changes are found in other sections of the country and are due in part to changing birth rates and in part to migration, which is highly selective by age.

Table B. Change in Population of Central Cities Through Annexation: 1960 to 1970

Central Cities	1970 population			Change 1960 to 1970 in 1960 population area	
	Total	In 1960 annexed area			
		1960 population	area		
Grand Rapids.....	197,649	158,694	38,955	-18,619	
Flint.....	193,317	193,131	186	-3,809	
Lansing.....	131,546	111,054	20,492	3,247	
Saginaw.....	91,849	91,675	174	-6,590	
Ann Arbor.....	99,797	88,505	11,292	21,165	
Kalamazoo.....	85,555	85,538	17	3,449	
Muskegon.....	44,631	40,404	4,227	-6,081	
Bay City.....	49,449	49,408	41	-4,196	

Low birth rates during the depression years and in the 1960's contribute to the diminution or slow growth of the population 25-44 and under 5 years, whereas the post-World War II "baby boom" is currently reflected in the large size of the population 15 to 24 years old.

Standard Metropolitan Statistical Areas

In 1970, there were 11 standard metropolitan statistical areas (SMSA's) in Michigan, all concentrated in the southern part of the State. One, the Toledo, Ohio-Mich. SMSA' is located mainly in Ohio: less than one-fifth of the population of this SMSA is in Michigan.

Between 1960 and 1970, the population of the Detroit SMSA, the largest metropolitan area in Michigan, grew from 3,762,000 to 4,200,000, or by 12 percent. The Detroit SMSA ranks fifth in population among all metropolitan areas in the Nation. Detroit is the center of America's automotive industry, and is the headquarters of the General Motors Corporation, Chrysler Corporation and the Ford Motor Company. It is a major port on the Great Lakes and an important commercial and financial center. The city's population was reduced by 159,000 over the decade (10 percent of its 1960 population) while the suburban population gained 596,000 (or 28 percent). The city's decline resulted from an extensive loss of white population (344,000) and a much smaller increase in the population of Negro and other races (185,000).

Detroit's white population loss was caused largely by a net outmigration of 387,000, equivalent to 33 percent of the city's white population in 1960. In common with other very large cities, however, the natural increase of Detroit's white population was very low: there was an excess of births over deaths of only 43,000 for this population group, a rate of less than 4 percent. Nationwide, the white rate of natural increase between 1960 and 1970 exceeded 10 percent, but in the central cities of the 12 largest SMSA's (with populations of 2 million or more) the white natural increase rate was under 5 percent.

By contrast, the growth of other races was founded almost equally on natural increase and net immigration. As a result of these changes the population of Negro and other races in the city of Detroit increased its share of the total population, from 29 percent in 1960 to 45 percent in 1970.

The white population loss from Detroit city affected every age group (see table 4). Conversely, the growth of other races was spread across all age groups, but the population 15-24 and 65 and over grew most rapidly (by 121 percent and 88 percent, respectively).

In spite of the rapid rate of growth of Negroes and other races in the Detroit suburbs (from 80,000 to 108,000, or by 35 percent), their representation in the

suburban population scarcely changed. In 1970 as in 1960, races other than white comprised 4 percent of Detroit's suburban population.

Michigan's second most populous metropolitan area, the Grand Rapids SMSA, grew from 462,000 to 539,000, or by 17 percent. The city of Grand Rapids is a manufacturing and wholesale trade center. It is nationally famous for its furniture manufacture. Between 1960 and 1970, the city grew from 177,000 to 198,000, a 12 percent increase. This increase is attributable to annexation of suburban territory. Without it, the city would have lost 19,000 population (table B).

The population of the Flint SMSA grew from 416,000 in 1960 to 497,000 in 1970, or by 19 percent. Virtually all population growth in this area was due to the natural increase of the population. Flint is second to Detroit in volume of automotive production and parts manufacturing. There was a slight reduction in the population of Flint city over the decade, from 197,000 to 193,000. The loss affected the white population only, which declined by 24,000, or 15 percent; other races increased by 20,000 persons, or 59 percent.

The population of the Lansing SMSA, which grew from 299,000 to 378,000, or by 27 percent, was the second fastest growing SMSA in the State. Lansing is one of the very few SMSA's in Michigan where net immigration was of significance to population growth. Net immigration in this area was equivalent to 10 percent of its 1960 population and account for one-third of overall growth. A large share of this growth is the result of increased enrollment at Michigan State University. More than one-half of the SMSA's total population increase occurred in the age group 15 to 24 years. The large increase in the population of Lansing city, the State capital (from 108,000 to 132,000), was produced mainly by annexation of a suburban population of 20,000.

The most rapid rate of growth during the decade occurred in the Ann Arbor SMSA, which grew by 36 percent, from 172,000 to 234,000. The area's growth was produced in equal part by natural increase and net immigration. The net immigration rate of 18 percent was the highest among the State's metropolitan areas. The city of Ann Arbor, the site of the University of Michigan, grew from 67,000 to 100,000. A large part of this growth was due to annexation of suburban territory. Due mainly to the presence of the University, both central city and suburban population growth was concentrated at age 15 to 24; more than one-half of the total SMSA increase (32,000) occurred at this age.

Between 1960 and 1970 the population of the Saginaw SMSA grew from 191,000 to 220,000, or by 16 percent. The central city declined by 7 percent; its loss was made up of a substantial decrease in white population (13,000) and a smaller gain in other races (6,000)

The proportion of the city's population which is of Negro and other races consequently grew, from 17 percent in 1960 to 25 percent in 1970, one of the highest percentages among Michigan's SMSA's.

The population of the Kalamazoo SMSA grew from 170,000 in 1960 to 202,000 in 1970, or by 19 percent. It was one of the few SMSA's in Michigan to grow as a result of net immigration. The city of Kalamazoo which is midway between Chicago and Detroit, is an industrial center and the site of Western Michigan University. The population of the city increased over the decade by only 4 percent, or 3,500 persons. Only one age group in the city shows an increase for this period, however: the 15 to 24 year old population--reflecting increased enrollment at the university as well as the high birth rate following World War II--grew by 11,000, or 68 percent over 1960.

The Muskegon-Muskegon Heights SMSA had the lowest rate of population increase and the highest rate of net outmigration of any metropolitan area in Michigan. Between 1960 and 1970 it grew from 150,000 to 157,000, by 5 percent. Net outmigration was equivalent to 9 percent of the total 1960 population of the SMSA. Both central cities lost population due to declines in the white population amounting to 11 percent in Muskegon and 32 percent in Muskegon Heights. The population of other races, by contrast, grew rapidly, by 76 percent in Muskegon and 20 percent in Muskegon Heights, although their numbers remain small in both cities (7,000 in Muskegon, or 15 percent of the total population, and 9,000 in Muskegon Heights, or 53 percent of the total population).

The Jackson and Bay City SMSA's are the two smallest metropolitan areas entirely within the State of Michigan, with 143,000 and 117,000 population, respectively. Their growth rates for the period were similar (9 percent and 10 percent). Each suffered a small net outmigration equivalent to 3 to 4 percent of their 1960 populations. Similarly, the populations of both central cities were reduced as a result of white population losses.

Counties

Of the 83 counties in Michigan, 70 gained and 13 lost population between 1960 and 1970. Of the 13 counties that lost population, all but one, Presque Isle County, were located in Michigan's Upper Peninsula. Thirty-nine counties had growth rates exceeding the national average of 13.3 percent and four counties had population declines exceeding 10 percent. Of the 17 counties in metropolitan areas in 1970, 12 gained at rates above the national average. Wayne County (Detroit SMSA), the third largest in the Nation, had almost no population change during the decade, however. The decline in the white population in Wayne County was offset by an increase in the population of Negro and other races.

During the 1960-70 decade, 12 counties had growth rates exceeding 30 percent. The population of Livingston County and Macomb County (Detroit SMSA) both grew 54 percent, respectively. More than 73 percent of the growth in Livingston County and 56 percent of the growth in Macomb County was due to net immigration.

Oscoda County located on Lake Huron, grew by 51 percent, the county's greatest relative increase since 1890. Net immigration accounted for half the growth. The rapid growth in the county was due to the location in recent years of a Strategic Air Command Unit in the county.

During the 1960 to 1970 period, 50 counties experienced net immigration. Only five counties--Clare, Livingston, Macomb, Oscoda and Roscommon--had an immigration rate exceeding 30 percent. Macomb County is the only one of the five that is in a metropolitan area.

Between 1960 and 1970, 10 counties in Michigan had rates of outmigration equivalent to 10 percent or more of their 1960 population. Six of these--Alger, Huron, Iron, Luce, Mackinac and Presque Isle--had more than half of their populations living in rural areas. The highest rate of net outmigration (20 percent) occurred in Chippewa County, located in Michigan's Upper Peninsula.

HOUSING TRENDS

General

Between 1960 and 1970 the total supply of housing units in Michigan increased more rapidly than population. The population grew by 1,052,000 or 13 percent, while housing units increased by 405,800 or 16 percent (table C).

The standard metropolitan statistical areas of the State experienced greater relative growth in housing, as in population, than did the nonmetropolitan part. The number of housing units in metropolitan areas rose over the decade to 2,126,400, an increase of

301,600 units, or 17 percent; this compares with an increase of 104,200 units, or 14 percent, in the nonmetropolitan areas. About 72 percent of all housing units were in the SMSA's; these areas accounted for 74 percent of the total State increase between 1960 and 1970.

Approximately 76 percent of the housing in Michigan consisted of one-unit structures in 1970. The proportion of such units in metropolitan areas was 73 percent, and in nonmetropolitan areas, 85 percent.

The number of units in the State lacking some or all plumbing facilities in 1970 was 123,800 units, or 4 percent. The corresponding proportions in metropolitan and nonmetropolitan areas were 2 percent and 10 percent, respectively (table D). About 8,000 or 3

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State Metropolitan and Nonmetropolitan Residence	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent

²Percent of all year-round housing units.

³Percent of all housing units.

percent, or the Negro-occupied units in the State lacked some or all plumbing in 1970. Inside metropolitan areas, 3 percent of the Negro-occupied housing lacked such plumbing, compared with 9 percent outside the metropolitan areas.

Households were smaller in 1970 than in 1960. In the metropolitan areas, average household size declined from 3.4 persons in 1960 to 3.3 in 1970 and in nonmetropolitan areas, from 3.4 to 3.2 persons. The number of one-person households increased by 62 percent in metropolitan areas and by 47 percent in nonmetropolitan areas. In comparison, households with five or more persons increased 10 percent in metropolitan areas and 5 percent in nonmetropolitan areas.

The median number of rooms in housing units for the State and for the metropolitan and nonmetropolitan areas was 5.2 in 1970. About 19 percent of the metropolitan housing units and 23 percent of units in nonmetropolitan areas had seven or more rooms.

Number of persons per room is often used as a measure of crowding. In Michigan, the proportion of housing units with 1.01 or more persons per room decreased during the decade. In 1960, 10 percent of all occupied housing units in both metropolitan and nonmetropolitan areas had 1.01 or more persons per room. By 1970, the proportion of such units had decreased to 8 percent in both areas.

The homeownership rate in Michigan remained at 74 percent during the decade. As in 1960, homeownership was more prevalent in nonmetropolitan areas. About 79 percent of the households in nonmetropolitan areas owned their homes, compared with 73 percent in metropolitan areas. Of the 1,974,500 owner-occupied units in the State, 1,481,000 were inside metropolitan areas and 493,500 were outside these areas.

About 53 percent of the Negro households in metropolitan areas and 61 percent in nonmetropolitan areas owned their homes in 1970. Of the 148,100 Negro-homeowner households in the State, 139,700 lived inside SMSA's and 8,400 lived outside SMSA's.

Property values and rents increased during the last decade. The median value of owner-occupied housing in metropolitan areas rose 47 percent, from \$12,600 to \$18,500, while in the nonmetropolitan areas value increased 43 percent, from \$9,000 to \$12,900. In metropolitan areas, median contract rent in 1970 was 48 percent higher than in 1960, rising from \$66 to \$98. In nonmetropolitan areas, the increase was 54 percent, from \$50 in 1960 to \$77 in 1970.

Value and rent are expressed in current dollars (the value at the time of the respective censuses). Thus, any comparison must take into account the general rise in the cost of living during the 10-year period, as well as changes in the characteristics of the housing inventory.

Standard Metropolitan Statistical Areas

In the metropolitan areas of the State, the housing supply increased by 301,600 units, or 17 percent. The Detroit SMSA, the largest in the State, contained 62 percent of the housing units in the metropolitan areas and accounted for 56 percent of the increase.

The suburban areas of the State experienced greater growth in housing than did the central cities. Housing units in the suburbs increased by about 30 percent, while housing in the combined central cities showed little change. By 1970, there were 1,276,100 housing units in the suburbs and 850,300 units in the central cities.

About 73 percent of the housing units in the State's metropolitan areas consisted of one-unit structures in 1970. The number of units in multifamily structures, however, increased at a much faster rate than one-unit structures during the decade, 38 percent and 9 percent, respectively.

In 1970, 52,000 housing units in metropolitan areas, or 2 percent of all year-round units, lacked some or all plumbing facilities. The corresponding proportions for the central cities and the suburbs were 3 percent and 2 percent, respectively. Approximately 5,600, or 2 percent of the Negro households in the central cities, occupied units which lacked some or all plumbing facilities in 1970; in suburban areas, 1,100 Negro households, or 3 percent, lacked such plumbing facilities.

Average household size in 1970 was 3.0 persons in the central cities and 3.5 persons in the suburbs. One-person households constituted 22 percent of all households in the central cities and 11 percent in the suburbs.

Housing units in the central cities were smaller in size than in the suburbs. In 1970, the median number of rooms in the central cities was 5.1, and in the suburbs, 5.3. While 17 percent of the housing in the central cities had one to three rooms, 8 percent of the housing units in the suburbs were in this category. At the same time, 16 percent of the units in the central cities had seven or more rooms, compared with 21 percent in the suburbs.

Of all occupied units in metropolitan areas, 155,100 or 8 percent reported more than one person per room in 1970; the corresponding figure was 10 percent in 1960. In 1970, the proportion of such units was 7 percent in the central cities and 8 percent in the suburbs.

Homeownership in 1970 was more prevalent in the suburban areas than in the central cities. About 80 percent of occupied units in the suburbs and 62 percent in the central cities were owner-occupied. The Negro-homeownership rate in the suburbs was 63 percent, compared with 52 percent in the central cities.

In the central cities of Michigan, the median value of owner-occupied housing rose 30 percent, from \$11,800 in 1960 to \$15,300 in 1970; in the suburbs, the median increased 55 percent, from \$13,300 to \$20,600. In 1970, about 10 percent of the owner-occupied housing in the central cities was valued at \$25,000 or more, compared with 32 percent in the suburbs. Median contract rent in the central cities and the suburbs was \$87 and \$126, respectively. In the central cities, 10 percent of renter occupied units rented for \$150 or more, compared with 34 percent in the suburbs.

The homeowner vacancy rate for metropolitan areas decreased during the decade from 1.4 to 0.9 percent. The rental vacancy rate decreased from 9.9 to 7.6 percent.

Annexations

Annexations occurred in each of the central cities except the cities of Detroit, Muskegon Heights, and Jackson (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

DEFINITIONS, EXPLANATIONS, AND SOURCES OF DATA FOLLOW THE TABLES.

For additional information on SMSA's which cross State lines, see PHC(2)-37 for Ohio.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIANs, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop-houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated no one was there to report them in the census. A similar approach was used for persons visiting in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of the areas as existed on January 1, 1970. As nearly as

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas*, PC(3)1A.) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2,3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as "extended cities"—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or "legal") city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the "other" category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: "Total" and "Negro". In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as "white" and "Negro and other races." This is the classification employed in the 1960 census, except that "nonwhite" was the term used for "Negro and other races." It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting "Negro" only for the broader "nonwhite" classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for "other races" was available, however, to construct a "Negro and other races" age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of "Negro" population and "Other races" where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inven-

tory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

¹ For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all renter-occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1960 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied, one-family houses on less than ten acres, without a

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units on places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations include farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent—Contract rent is the monthly rent agreed to or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

The 1960 rent tabulations excluded farm units and vacant units on 10 or more acres in rural areas. In 1970, all one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.

FINAL REPORT

General Demographic Trends for Metropolitan Areas, 1960 to 1970

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by county appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and county in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce Field Offices, 25 cents.

POPULATION TRENDS

General

Between 1960 and 1970 the total population of Minnesota grew by 391,000, from 3,414,000 to 3,805,000, an increase of 11.5 percent over the population living in the State in 1960 (table A). While the metropolitan areas of the State grew by 19 percent, nonmetropolitan areas increased by only 3 percent. Nearly 90 percent of the total State increase (347,000 persons) was accounted for by the metropolitan areas.

Within Minnesota's metropolitan areas, all growth occurred in the suburban rings, where population increased by 385,000 or 45 percent. Central cities show a slight loss of 38,000 population, or 4 percent.

As a result of these changes, there was a rise in the proportion of total State population living in metro-

politan areas. In 1960, metropolitan areas accounted for 53 percent of the population; by 1970, this had increased to 57 percent. In the Nation as a whole nearly 70 percent of the population is metropolitan.

The total number of households in the State in 1970 was 1,154,000 or 162,000 more than in 1960. The population living in households increased less rapidly than the rate at which households increased, with the result that average household size decreased slightly, from 3.4 to 3.2 persons.

In both 1960 and 1970, more than 98 percent of Minnesota's population was white. Other races (slightly more than half of which are Negro) increased far more rapidly than the white population: while the white population grew by 11 percent, other races increased by 63 percent. Nearly 80 percent of races other than white lived in the metropolitan areas of the State in 1970, a considerably higher proportion than in 1960 (71 percent).

¹See correction note on page 8.

The growth of the State reflected an excess of births over deaths (natural increase) of 417,000, and a small net outmigration of 25,000 persons. In metropolitan areas, population growth was the result of both natural increase (268,000) and net immigration (79,000). The central cities' loss was produced by a substantial outmigration of 132,000 persons, equivalent to 14 percent of the population of the cities in 1960. By contrast, net immigration was of great importance to the growth of the suburbs, which gained 211,000 persons from this source, equivalent to 25 percent of 1960 population.

All areas of the State experienced significant changes in age composition (see table 4). The population under 5 years of age declined by 14 percent in metropolitan areas and by 28 percent in nonmetropolitan areas. The most rapidly growing group was 15 to 24 years of age, which increased by 62 percent in metropolitan areas and 34 percent in nonmetropolitan areas.

The central cities' population loss was felt by all age groups except for 15 to 24 years and 65 years of age and over, while the suburbs show gains at all ages except the youngest (under 5).

Age changes similar to those which occurred in the State as a whole are found in other sections of the country. They are due in part to changing birth rates and in part to migration, which is highly selective by age. Low birth rates during the 1960's contribute to the diminution of the population under 5, whereas the post-World War II "baby boom" is currently reflected in the large size of the population 15-24 years old.

Standard Metropolitan Statistical Areas

The Minneapolis-St. Paul Standard Metropolitan Statistical Area (SMSA) is the 15th largest metropolitan area in the Nation. Between 1960 and 1970, its population increased from 1,482,000 to 1,814,000. In 1970, the SMSA as a whole accounted for 48 percent of Minne-

sota's total population and 84 percent of the entire metropolitan population of the State.

The SMSA provides services of various kinds to a regional market area. St. Paul is the capital of Minnesota. Minneapolis has a broad manufacturing base, especially in nonelectric machinery.

The other SMSA's in Minnesota are small and limited in function. The Duluth-Superior, Minn.-Wis. SMSA is the next largest in Minnesota. It is a mining and manufacturing area which has been declining. Between 1960 and 1970, its population dropped from 277,000 to 265,000 (the Minnesota portion declined from 232,000 to 221,000). Next in size is the newly-created Rochester SMSA. In 1960 its population numbered 66,000; by 1970 it had increased to 84,000. The area is widely known for its medical facilities.

Nearly 40 percent of the Fargo-Moorhead, N. Dak.-Minn. SMSA is located in Minnesota. Between 1960 and 1970, the Minnesota portion of this SMSA increased from 39,000 to nearly 47,000.

Between 1960 and 1970, the cities of Minneapolis and St. Paul both lost population as a result of outmigration. Minneapolis suffered an overall reduction in population of more than 48,000 (10 percent) and a net outmigration of 87,000 persons. St. Paul's loss was smaller, amounting to 3,400 overall (1 percent) with a net outmigration of 38,000 persons. The suburban ring, by contrast, gained a population of 384,000, a large part of which was produced by net immigration (see table 3).

Duluth city's population was likewise reduced over the decade, by 6,300 persons, or 6 percent. This loss was also produced by outmigration (15,000 persons).

Annexation of territory during the decade played a significant role in the growth of Rochester city, where it accounted for more than 50 percent of the city's increase of 13,000 (table B). In Moorhead annexation was also a factor in producing part of the central city's growth (1,300 of the city's increase of 6,800).

Table B. Change in Population of Central Cities Through Annexation: 1960 to 1970

			22,934 5,438
			40,663 6,060

Counties

Between 1960 and 1970, 45 of the 87 counties in Minnesota increased in population. Fifteen of the 45 registered larger population increases than the 1960-70 percentage of 13.3 for the Nation. Five of the counties comprised the Minneapolis-St. Paul SMSA and the others were adjoining counties. The counties with the largest gains were: Anoka (80 percent), Dakota (79), Washington (58), Scott (48), Sherburne (43), Carver (33), Chisago (30), and Wright (30).

The 42 counties with declining populations are spread throughout the State with the exception of one segment. This is a belt of growing counties running North-South and through the Minneapolis-St. Paul area. Twelve of the declining counties had decreases of more than 10 percent. These were located on the western border of the State. Some of the counties with the largest losses were: Kittson (18 percent), Traverse (17), Lac qui Parle (16), Lincoln (16), and Murray (15).

Every county had more births than deaths during the decade. In the 42 counties with declining population, net outmigration over the decade was large enough to offset the excess of births over deaths. The counties with the largest net outmigration were relatively small. They tend to be concentrated along the western border of Minnesota. These included Murray, Traverse, Mahnomen, Wilkin and Lincoln. Counties with largest net immigration are part of the Minneapolis-St. Paul SMSA, or adjoin it. These counties were Dakota, Anoka, Washington, Sherburne, Scott, and Chisago.

HOUSING TRENDS

General

Between 1960 and 1970, the total supply of housing units in Minnesota increased somewhat more rapidly than population. The population grew by 391,000, or 11 percent, while housing units increased by 156,900, or 14 percent (table C).

The metropolitan areas of the State experienced greater relative growth in housing, as in population, than did the nonmetropolitan part. The number of housing units in metropolitan areas rose over the decade to 698,300, an increase of 122,500 units, or 21 percent; this compares with an increase of 34,500 units, or 6 percent, in nonmetropolitan areas. While the metropolitan areas contained 55 percent of the housing in Minnesota, the additions to the housing supply in these areas accounted for 78 percent of the State's total housing increase between 1960 and 1970.

About 73 percent of the housing in Minnesota consisted of one-unit structures in 1970. Corresponding proportions of such units were 65 percent in metropolitan areas and 85 percent in nonmetropolitan areas.

Households were smaller in 1970 than in 1960. In the metropolitan areas of the State, average household size declined from 3.3 persons in 1960 to 3.2 in 1970, and in nonmetropolitan areas, from 3.5 persons in 1960 to 3.2 in 1970. During the same period, in Minnesota, there were large percentage increases in one- and two-persons households, 51 percent and 22 percent, respectively.

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State
Metropolitan and
Nonmetropolitan Residence

	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent		
Total.....	1,276,198	1,119,271	156,927	14.0	11.5	
Metropolitan residence.....	698,336	575,865	122,471	21.3	19.1	
Inside central cities....	336,212	331,288	4,924	1.5	-4.0	
Outside central cities...	362,124	244,577	117,547	48.1	45.2	
Nonmetropolitan residence..	577,862	543,406	34,456	6.3	2.8	

with relatively small gains in households with three or more persons.

The number of units in the State lacking plumbing was 99,500 in 1970, or 8 percent of all year-round units. This compares with 4 percent in metropolitan areas and 13 percent in nonmetropolitan areas.

Number of persons per room is often used as a measure of crowding. In Minnesota both the number and proportion of housing units with 1.01 or more persons per room decreased during the decade. In 1960, 10 percent of all occupied housing units in metropolitan areas and 11 percent in nonmetropolitan areas had 1.01 or more persons per room. By 1970, the proportion of such units decreased to 7 percent in metropolitan areas and 8 percent in nonmetropolitan areas (table D).

Homeownership in the State decreased from 72 percent in 1960 to 71 percent in 1970. In metropolitan areas there was a decrease from 69 percent to 66 percent, while in nonmetropolitan areas the proportion rose from 76 to 78 percent.

Property values and rents increased in the last decade. The median value in metropolitan areas increased by 44 percent from \$14,300 in 1960 to \$20,600 in 1970, while in the nonmetropolitan areas value increased 33 percent, from \$9,800 to \$13,000. In metropolitan areas, median contract rent in 1970 was 76 percent higher than in 1960, rising from \$66 to \$116. In nonmetropolitan areas rent increased from \$47 to \$70, or 49 percent.

Value and rent are expressed in current dollars (the value at the time of the respective censuses). Thus, any comparison must take into account the general rise in the cost of living during the 10-year period, as well as changes in the characteristics of the housing inventory.

Standard Metropolitan Statistical Areas

In the metropolitan areas of the State (Duluth-Superior, Minn.-Wis., Fargo-Moorhead, N. Dak.-Minn., Minneapolis-St. Paul, and Rochester), the housing supply increased by 122,500 units, or 21 percent. The Minneapolis-St. Paul SMSA which contained 83 percent of the housing accounted for 93 percent of the increase. The Duluth-Superior and Fargo-Moorhead metropolitan areas have central cities in adjoining States.

Average household size for the total metropolitan area of the State declined during the decade. The average in the central cities declined from 2.9 persons in 1960 to 2.7 in 1970, and in the suburbs from 3.8 persons to 3.6.

The rate of homeownership in 1970 was greater in the suburban areas than in the central cities. About 78 percent of occupied units in the suburbs were owner-occupied, compared with 54 percent in the central cities.

In 1970, 30,100 housing units in metropolitan areas, or 4 percent of all units, lacked some or all plumbing facilities. The corresponding proportion was 6 percent in the central cities and 3 percent in the suburbs. In the

Table D. Plumbing Facilities and Persons Per Room by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

²Percent of all year-round housing units.

³Percent of all housing units.

Minnesota part of the Duluth-Superior, Minn.-Wis. SMSA, and in the Rochester SMSA, however, the percentage of such units was lower in the central cities than in the suburbs, i.e., in Duluth, 8 percent in the central city lacked some or all plumbing facilities compared with 15 percent in its suburbs in Minnesota. Likewise, in Rochester the percentages were 4 and 6, respectively.

Of all occupied units in metropolitan areas, 45,500 units, or 7 percent, reported more than one person per room in 1970 compared with 10 percent in 1960. In 1970, the proportion of such units was 5 percent in the central cities and 8 percent in the suburbs.

The homeowner vacancy rate for metropolitan areas decreased during the decade from 1.1 to 0.5 percent. The rental vacancy rate decreased from 6.1 to 5.5 percent.

Annexations

Annexations occurred in the central cities of Minneapolis, Duluth, Moorhead, and Rochester, during the decade (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

DEFINITIONS, EXPLANATIONS, AND SOURCES OF DATA FOLLOW THE TABLES.

CORRECTION NOTE

The corrected 1970 State figure for population is 3,805,069 and for housing is 1,276,227. Detailed distributions shown in this report have not been revised to reflect these corrections, because the errors were discovered after the tabulations were completed. Further information will be provided in the PC(1)-B and HC(1)-A final reports for this State.

For additional information on SMSA's which cross State lines, see PHC(2)-36 for North Dakota and PHC(2)-51 for Wisconsin.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIANs, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop-houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated no one was there to report them in the census. A similar approach was used for persons visiting in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of the areas as existed on January 1, 1970. As nearly as

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas*, PC(3)1A.) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2, 3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as “extended cities”—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or “legal”) city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the “other” category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: “Total” and “Negro”. In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as “white” and “Negro and other races.” This is the classification employed in the 1960 census, except that “nonwhite” was the term used for “Negro and other races.” It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting “Negro” only for the broader “nonwhite” classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for “other races” was available, however, to construct a “Negro and other races” age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of “Negro” population and “Other races” where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inven-

tory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

¹ For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all renter-occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1960 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied, one-family houses on less than ten acres, without a

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units in places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations exclude farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent—Contract rent is the monthly rent agreed or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations. The 1960 rent tabulations excluded farm units and nonfarm units on 10 or more acres in rural areas. In 1970, one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

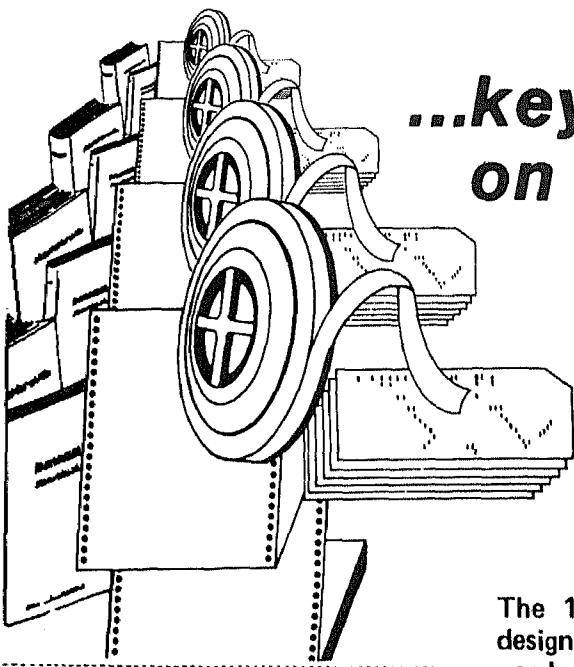

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.

...key resources on Census '70

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

PARTS 1 and 2 of the 1970 Census Users' Guide @ \$4.00 for both

PART 1 only of the 1970 Census Users' Guide @ \$1.25 per copy C3.6/2:C33/4/970/PT.1

PART 2 only of the 1970 Census Users' Guide @ \$2.75 per copy C3.6/2:C33/4/970/PT.2

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the Guide (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

MISSISSIPPI

FINAL REPORT

General Demographic Trends
for Metropolitan Areas, 1960 to 1970

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by county appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and county in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

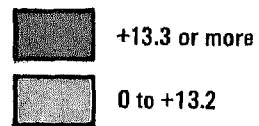

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce Field Offices, 15 cents.

POPULATION TRENDS

General

Between 1960 and 1970 the total population of Mississippi grew from 2,178,000 to 2,217,000, an increase of only 1.8 percent over the population living in the State in 1960 (table A). This rather small increase reflects the outmigration of Negroes (who constituted 37 percent of the population in 1970) from the State. While the white population had a growth of 10.7 percent, the Negro population had a loss of 10.5 percent. As a result of extensive outmigration from nonmetropolitan areas, there was a very slight loss of population from these areas of about 1 percent. In metropolitan areas, there was a population gain of 15.4 percent.

The total number of households in the State in 1970 was 637,000 or 69,000 more than in 1960. The population living in households increased less rapidly

than the rate at which households increased with the result that average household size decreased from 3.8 to 3.4 persons per unit.

The effect of these changes on population distribution by metropolitan-nonmetropolitan residence was very small. The proportion of the total population living in the State's two Standard Metropolitan Statistical Areas (SMSA's), Jackson and Biloxi-Gulfport, increased by only 2 percent during the decade from 15.6 to 17.7. Less than one in five persons in Mississippi lives in metropolitan areas compared with a national average of two out of three.

Similar changes are found in other sections of the country and are due in part to changing birth rates and in part to migration, which is highly selective by age. Low birth rates during the depression years and in the 1960's contribute to the diminution of age groups 25 to 44 and under 5, whereas the post-World War II "baby boom" is currently reflected in the large size of the population 15 to 24 years old.

Analytical Text

POPULATION TRENDS

General

Between 1960 and 1970 the total population of Mississippi grew from 2,178,000 to 2,217,000, an increase of only 1.8 percent over the population living in the State in 1960 (table A). This rather small increase reflects the outmigration of Negroes (who constituted 37 percent of the population in 1970) from the State. While the white population had a growth of 10.7 percent, the Negro population had a loss of 10.5 percent. As a result of extensive outmigration from nonmetropolitan areas, there was a very slight loss of population from these areas of about 1 percent. In metropolitan areas, there was a population gain of 15.4 percent.

The total number of households in the State in 1970 was 637,000 or 69,000 more than in 1960. The population living in households increased less rapidly

than the rate at which households increased with the result that average household size decreased from 3.8 to 3.4 persons per unit.

The effect of these changes on population distribution by metropolitan-nonmetropolitan residence was very small. The proportion of the total population living in the State's two Standard Metropolitan Statistical Areas (SMSA's), Jackson and Biloxi-Gulfport, increased by only 2 percent during the decade from 15.6 to 17.7. Less than one in five persons in Mississippi lives in metropolitan areas compared with a national average of two out of three.

Similar changes are found in other sections of the country and are due in part to changing birth rates and in part to migration, which is highly selective by age. Low birth rates during the depression years and in the 1960's contribute to the diminution of age groups 25 to 44 and under 5, whereas the post-World War II "baby boom" is currently reflected in the large size of the population 15 to 24 years old.

Standard Metropolitan Statistical Areas

Mississippi has two SMSA's: Jackson and Biloxi-Gulfport. The former has about twice the population of the latter. Jackson is the capital of Mississippi, a financial, commercial and trade center for the State which has diversified manufacturing industry. About one-third of its population is Negro. Biloxi-Gulfport, a recently recognized metropolitan area, sits on the Gulf of Mexico. It has oil and gas mining and carries on some port activities. Its population in 1970 was 135,000 with about 17 percent Negro.

Annexation of territory during the decade was responsible for additions to the cities of Biloxi and Gulfport of 11,800 and 9,900 (table B). Biloxi would have declined in population if not for the annexation. Gulfport, however, was little affected.

The change in the pattern of age distribution over the decade for Jackson and Biloxi-Gulfport was generally similar to that for the State as a whole. It consisted of losses for age groups under 5 and 25 to 44 and substantial increases in age groups 15 to 24, 45 to 64, and 65 and over. In the entire Biloxi-Gulfport SMSA, there was an increase from 23,500 to 31,000 in the 15 to 24 year group. For Jackson, the increase for this group was from 34,000 to 48,000.

Counties

Between 1960 and 1970, 33 of Mississippi's 82 counties increased in population size. Only eight of these counties had growth rates of 13.3 percent (the national average) or more. Four of these counties (Pearl River, Hancock, Stone and Jackson) were in the southeastern corner of

Mississippi bordered by the Mississippi River, the Gulf of Mexico and the Mobile SMSA in Alabama. Jackson County, on the border with Mobile, had a 58 percent growth rate, highest in the State.

Another county bordering an SMSA, De Soto, alongside the Memphis, Tennessee SMSA, had the second highest growth rate—50.2 percent. Hinds and Rankin Counties, which comprise the Jackson SMSA, had growth rates of 15 percent and 28 percent, respectively. Another fast-growing county, Lee, is in the northeastern part of the State and had a 13.7 percent growth rate.

In only seven of the 82 counties did Negroes register gains in population. Five of these are the adjoining counties of Stone, George, Hancock, Harrison and Jackson, located in the rapidly growing southeastern part of the State. Negroes increased also in Hinds County (part of the Jackson SMSA) and in Prentiss County in the northwestern part of the State.

Every county had more births than deaths during the decade. In most cases, however, net outmigration was more than sufficient to offset the natural increase. Only nine counties had net immigration and only five of these had a significant inflow. They were: De Soto, Rankin, Pearl River, Hancock and Jackson.

The net outmigration included both whites and Negroes. The incidence was much heavier for the latter. There were 12 counties in which net outmigration of Negroes and other races amounted to more than 40 percent of their 1960 population. These counties were largely on the central and eastern boundary of the State, bordering on the Mississippi River (see Map). These counties are: Tunica, Quitman, Tallahatchie, Bolivar, Sunflower, Leflore, Humphreys, Sharkey, Issaquena, Tate, Madison, and Carroll.

Table B. Change in Population of Central Cities Through Annexation: 1960 to 1970

HOUSING TRENDS

General

During the decade, the total supply of housing units in Mississippi increased more rapidly than population. While the population grew by 39,000, or 2 percent, the number of housing units increased by 70,200, or 11 percent (table C).

The metropolitan areas of the State experienced greater relative growth in housing, as in population, than did the nonmetropolitan part. The number of housing units in metropolitan areas rose from 97,300 to 120,900 over the decade, an increase of 23,600 units, or 24 percent; this compares with an increase of 46,600 units, or 9 percent, in nonmetropolitan areas. While the metropolitan areas contained 17 percent of the housing in Mississippi, additions to the housing supply in these areas accounted for about 34 percent of the State's total housing increase between 1960 and 1970.

About 86 percent of the housing in Mississippi consisted of one-unit structures in 1970. The number of units in multiunit structures, however, increased at a faster rate than one-unit structures during the decade, 34 percent and 5 percent, respectively.

The size of housing units increased between 1960 and 1970. The median number of rooms rose from 4.7 to 5.0 in metropolitan areas and from 4.5 to 4.9 in nonmetropolitan areas. Units with one to three rooms declined in the State, whereas those with five rooms or more had relatively large percentage increases over the decade.

Households were smaller in 1970 than in 1960. In metropolitan areas, population per occupied unit declined from 3.6 in 1960 to 3.3 in 1970, and in nonmetropolitan areas, from 3.8 in 1960 to 3.4 in 1970. There were large percentage increases in one-person households, 72 percent in metropolitan areas and 59 percent in nonmetropolitan areas. Households with five or more persons showed relatively small gains in metropolitan areas and losses in nonmetropolitan areas.

The proportion of housing units lacking some or all plumbing facilities decreased from 48 to 24 percent during the decade in Mississippi. For metropolitan areas the proportion of units without complete plumbing facilities in 1970 was 8 percent as compared with 28 percent for nonmetropolitan areas.

Number of persons per room is often used as a measure of crowding. In Mississippi units with 1.01 or more persons per room comprised 15 percent of all occupied units in 1970, compared with 23 percent in

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State Metropolitan and Nonmetropolitan Residence	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent		
Total.....	699,150	628,945	70,205	11.2	1.8	
Metropolitan residence....	120,899	97,322	23,577	24.2	15.4	
Inside central cities....	78,015	63,292	14,723	23.3	11.2	
Outside central cities...	42,884	34,030	8,854	26.0	23.0	
Nonmetropolitan residence..	578,251	531,623	46,628	8.8	-0.8	

1960 (table D). The number of all such units in 1970 was 96,300, a decrease of about 37,100, or 28 percent, between 1960 and 1970. The decline occurred in metropolitan and nonmetropolitan areas alike.

Homeownership in the State increased from 58 percent in 1960 to 66 percent in 1970. In metropolitan areas there was an increase from 60 to 64 percent, while in nonmetropolitan areas the proportion increased from 57 to 67 percent.

Property values and rents increased during the last decade. The median value of owner-occupied homes in metropolitan areas increased by 33 percent (\$10,500 in 1960 to \$14,000 in 1970), while in nonmetropolitan areas value increased 48 percent (\$7,100 in 1960 to \$10,500 in 1970). In metropolitan areas, median contract rent in 1970 was 35 percent higher than in 1960, rising from \$49 to \$66.

Value and rent are expressed in current dollars (the value at the time of the respective censuses). Thus, any comparison must take into account the general rise in the cost of living during the 10-year period as well as changes in the characteristics of the housing inventory.

Standard Metropolitan Statistical Areas

Of the two metropolitan areas in the State (Jackson and Biloxi-Gulfport), the Jackson SMSA accounted for about two-thirds of the housing in these areas in 1970. The increase in the housing supply in these SMSA's during the decade was 23,600 units, of which nearly

three-fourths (17,300) was in the Jackson area. This produced a 28-percent increase in the Jackson SMSA and 18 percent in the Biloxi-Gulfport SMSA.

Average household size for the total metropolitan area of the State declined during the decade. Population per occupied unit in the central cities was 3.1 in 1970, compared with 3.6 in the suburbs.

The rate of homeownership was greater in the suburban areas than in the central cities. About 77 percent of occupied units in the suburbs were owner-occupied, compared with 58 percent in the central cities.

In 1970, 2 percent of all year-round units lacked some or all plumbing facilities in the central cities, compared with 17 percent in the suburbs. Of all occupied units in metropolitan areas, 14,000 units, or 13 percent, reported more than one person per room in 1970, compared with 18 percent in 1960. In 1970, the proportion of such units was 11 percent in the central cities and 15 percent in the suburbs.

The homeowner vacancy rate for metropolitan areas decreased during the decade, from 2.1 percent in 1960 to 1.7 percent in 1970. The rental vacancy rate increased, however, from 7.7 to 9.2 percent.

Annexations

Annexations occurred in the central cities of Biloxi and Gulfport during the decade (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIAN, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop-houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated no one was there to report them in the census. A similar approach was used for persons visiting, in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of the areas as existed on January 1, 1970. As nearly as

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas*, PC(3)1A.) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2,3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as “extended cities”—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or “legal”) city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the “other” category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: “Total” and “Negro”. In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as “white” and “Negro and other races.” This is the classification employed in the 1960 census, except that “nonwhite” was the term used for “Negro and other races.” It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting “Negro” only for the broader “nonwhite” classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for “other races” was available, however, to construct a “Negro and other races” age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of “Negro” population and “Other races” where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inven-

tory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

¹For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all renter-occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1960 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied, one-family houses on less than ten acres, without a

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units on places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations include farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent—Contract rent is the monthly rent agreed to or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

The 1960 rent tabulations excluded farm units and vacant units on 10 or more acres in rural areas. In 1970, all one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.
